# **1D CSAMT INVERSION TUTORIAL**

updated December, 2017

# *Note: This inversion is for a 3D source. This is not MT inversion !*

Steps:	Page
1. Data organization and import	2
2. Examine data through plots and Survey Editor	7
3. Perform initial modeling	15
4. Perform controlled inversions	17
5. Inversion evaluation	25

- 2. Examine data
- 3. Perform initial modeling
- 4. Perform controlled inversions
- 5. Inversion evaluation

# The data in EMIGMA is organized into Projects, Surveys and Data Sets.

Across the top, there are four tabs, *Database* (view shown above), *Survey Review*, *Data Correction* and *Data Reduction*, as discussed on the next page.

1. Data organization and import	CSAMT Inverse
2. Examine data	3
3. Perform initial modeling	
4. Perform controlled inversions	
5. Inversion evaluation	

*Database* – Organizes the data into Projects, Surveys and Data Sets. For each data set, any corresponding models and grids are also shown (if the appropriate 'model' or 'grid' button is checked)

*Survey Review* - Allows the user to review the lines and data points. Data sorting, filtering and profile name modification options are available.

Data Correction – Enables the user to delete points and components. The user can also modify values in a number of ways such as applying a shift, multiplication by a factor, inverting the sign, etc.

*Data Reduction* – Allows the user to reduce entire data sets (measured or simulated) in a single operation

For a detailed description of each feature, please refer to the EMIGMA Manual.

#### 1. Data organization and import

- 2. Examine data
- Perform initial modeling 3.
- Perform controlled inversions 4
- 5. Inversion evaluation

#### CSAMT data can also be imported through generic CSAMT import from a .qct file or directly with either Zonge or Phoenix data files

# Browse and select data file for import

**CSAMT** Inverse

#### 1. Data organization and import

- 2. Examine data
- 3. Perform initial modeling
- 4. Perform controlled inversions
- 5. Inversion evaluation

- 1. Data organization and import
- 2. Examine data
- 3. Perform initial modeling
- 4. Perform controlled inversions
- 5. Inversion evaluation

In this tutorial, we will be working with the *CSAMT demo database* available through our website.

We will start by examining a synthetic data set in a project titled CSAMT Theory.

Select the survey and data sets as shown (on the right) in the database:

	$\sim$	
斋		Viz
		-

Project ID: 12 Date Created: 6/27/2014 10:00:04 PM Project Name: CSAMT Theory	fields impedances t1 impedances t2 impedances t3 dipping impedances back

Click the *Plotter* button on the toolbar to load the 'Fields' and 'impedances t1' data sets.

With the *Plotter*, the user can display not only the electric field and magnetic field data but also the impedance data (with the respective real and imaginary components).

- 1. Data organization and import
- 2. Examine data
- 3. Perform initial modeling
- 4. Perform controlled inversions
- 5. Inversion evaluation

CSAMT Inverse 9

The figure below shows the *Hy* component with the real component (in red), the imaginary component (in blue) and the amplitude (green) -- all on the same plot. The plot is shown in Spectrum mode on the next page.

- 1. Data organization and import
- 2. Examine data
- 3. Perform initial modeling
- 4. Perform controlled inversions
- 5. Inversion evaluation

CSAMT Inverse 10

The plot below shows the *Hy* component in Spectrum mode. Here, the response is shown as a function of frequency. The Real component is shown in **red**, the imaginary component in **blue** and the amplitude in **green** – as indicated on the previous page. The Fields/Component dialog is discussed on the next page.

- 1. Data organization and import
- 2. Examine data
- 3. Perform initial modeling
- 4. Perform controlled inversions
- 5. Inversion evaluation

Click "Channels" button on the toolbar and select "Field" in the popup dialog (as shown)

Check "Phase" option, and click "OK" to display the phase

Phase (degrees)

# CSAMT Inverse 11

- 1. Data organization and import
- 2. Examine data
- 3. Perform initial modeling
- 4. Perform controlled inversions
- 5. Inversion evaluation

You can also switch between electric field and magnetic fields. Click the domain 🕎 button on the toolbar to view the following dialog:

- 1. Data organization and import
- 2. Examine data
- 3. Perform initial modeling
- 4. Perform controlled inversions
- 5. Inversion evaluation

You can also plot the impedance data using the *Plotter*.

Select the 'Impedance/Magnetic Ratio' data sets in the same survey after selecting the *Plotter* button to load the data set.

Double-click the white background on the plotter window to access the *Channel Selection* dialog.

Then click the 'Field' button to access the '*MT/CSAMT/VLF Tensor Selection*' window, shown on the right.

Check 'Real' and 'Imaginary' components and the impedance tensors, Zxy, Zyx, to display the data.

You can also switch between 'Apparent Resistivity' and 'Phase' by checking the appropriate boxes.

An example plot is shown on the next page.

#### 2. Examine data

- 3. Perform initial modeling
- 4. Perform controlled inversions
- 5. Inversion evaluation

To illustrate the different plotting capabilities for an impedance data set, an example from the Costa Rica Project is shown below:

Both the 'real' and 'imaginary' components of Zxy are shown in red and blue respectively. The corresponding 'Phase' and 'Apparent Resistivity' plots are shown on the right.

To access the CSAMT Tensor selection options for plotting, double-click the white background on the Plotter window and then click the 'Field' button

### **CSAMT** Inverse 14

a. 18622 512 Hz Zou Totlau M

- 1. Data organization and import
- 2. Examine data
- 3. Perform initial modeling
- 4. Perform controlled inversions
- 5. Inversion evaluation

The object is to perform some initial modeling in order to get a "feel" for the background resistivity and thus estimate the parameters for the 'initial model', which is to be used for inversion.

#### EM Response

- 1. Data organization and import
- 2. Examine data
- 3. Perform initial modeling
- 4. Perform controlled inversions
- 5. Inversion evaluation

You can view existing models for a data set by clicking the *Model* button, as shown:

#### CSAMT Inverse 19

# Inversion style

# Inversion style:

There are two distinct inversion techniques that are available:

# **Trust Region**

An underparametrized technique with a fast rate of convergence. Utilizes (user-defined) simple bound constraints to solve the least-squares minimization problem. Inverts for both resistivity and thickness.

#### Occam

Over-parameterized and smooth inversion. Each layer has a fixed thickness and the inversion only inverts for resistivity.

Please refer to the Help section of EMIGMA or the EMIGMA manual for more details.

- 1. Data organization and import
- 2. Examine data
- 3. Perform initial modeling
- 4. Perform controlled inversions
- 5. Inversion evaluation

# CSAMT Inverse 20

### Choose frequencies for inversion

After examining your data, choose which frequencies you wish to utilize for inversion. The best model will be computed for all frequencies for comparison.

#### **Inversion Controls**

In CSAMT, *Vx* and *Hy* fields are typically measured, and impedance *Zxy* will then be processed from field data. It is standard to use impedance data for inversion, but using field data would give you information not included in impedance such as, the variation along profile is mainly in current (E-field), or both fields for anomaly.

As this inversion process is suitable when the ground is smoothly varying laterally, you may choose to use the previous data point's final model as the starting model for the next point. This will also speed up the process.

- 1. Data organization and import
- 2. Examine data
- 3. Perform initial modeling
- 4. Perform controlled inversions
- 5. Inversion evaluation

enerate unifo	orm lavers	· · ·

4	2123.578613	100000000.000000	without bound limits. To make changes, click "Model Constraints".

# Create a Starting Model

**Import Layers**: If you have created a forward model that you like, you may import it as a starting model or if you have a previous inversion that you like, you may import it as a starting model.

**CSAMT** Inverse

21

**Insert a layer:** You may insert additional layers at any stage.

#### Generate a Starting model:

First select how many layers in total that you would like in the model, set the initial resistivity and thickness. Then click "Generate Uniform Layers".

#### **Modify Starting model**:

After making a starting model (whether by importing or generating), you may edit the resistivity and the thickness of the layer by simply double-clicking on the parameter (value).

- 1. Data organization and import
- 2. Examine data
- 3. Perform initial modeling
- 4. Perform controlled inversions
- 5. Inversion evaluation

# CSAMT Inverse 22

### **Constrain Model Parameters**

# **Resistivity Constraints**:

It is useful to constrain the layer resistivities to ranges that are possible in the geological environment.

#### **Thickness Constraints**:

This option is only available under the *Trust Region* technique.

Constraining the thickness not be too large helps gain resolution. Constraining the thinness of the layer is a question of geological meaningfulness.

**Note**: You do not have to invert every parameter.

- 1. Data organization and import
- 2. Examine data
- 3. Perform initial modeling
- 4. Perform controlled inversions
- 5. Inversion evaluation

# Executing the Inversion

24

Upon clicking **Run**, a window will pop-up. Unless the user is familiar with these items then it is suggested that the defaults be maintained.

> Number of Iterations: A higher value will help ensure accuracy but execution time increases

Target Fit: The residual between the estimated data under the best model and the measured data.

# The settings below are generally not changed by the user:

Model epsilon: Occam is a smooth inversion and the model epsilon controls the smoothness.

Min tolerance: Specifies how accurately the search algorithms determine minima in the fit.

Fit tolerance: Specifies how close to determine the final fit.

- 1. Data organization and import
- 2. Examine data
- 3. Perform initial modeling
- 4. Perform controlled inversions
- 5. Inversion evaluation

In each survey, there will be several data sets after modeling, inversion and processing. In this case, we have one 1D model and 3 inversions. The forward model has a new data set containing the simulated data under the model. Similarly, each inversion contains a new dataset containing the simulated data set under the inversion model (for each point) and attached to that data set is the inversion model.

- 5. Inversion evaluation

CSAMT Inverse 34

The user may select other data sets to plot by simply double clicking on the plot

Select for the 2<sup>nd</sup> plot, the same / frequency and then measured data and further datasets if required.

- 1. Data organization and import
- 2. Examine data
- 3. Perform initial modeling
- 4. Perform controlled inversions
- 5. Inversion evaluation

CSAMT Inverse 35

Multiple plots can be shown for various inversions and models in "Profile" mode. The user may step through different frequencies by simply clicking the 'arrows'.

||||||♥ů 聞Q@@≤ XIX || ≥ B || ≥ 90♥ 1| > 10 + 1 > M + 1 > M +

- 1. Data organization and import
- 2. Examine data
- 3. Perform initial modeling
- 4. Perform controlled inversions
- 5. Inversion evaluation

CSAMT Inverse 36

Here, spectrums are compared for a single data point in linear-linear mode. The user may move to other data points by simply clicking the arrows.

is accessed by doubleclicking either axis.

# Inversion Evaluation

CSAMT Inverse 38

Here, we select log(time) vs log(amplitude)

In CSAMT/MT, it is common to observe data in **Descending** order of frequencies (from high to low)

**Note**: based on results of inversion, you may run additional inversions with different settings, and compare the resulting sections in the CDI viewer and the fit in the plotter.
